EggVyapar

License Activation Guide

How you generate lifetime license keys and how your customers activate the app — end to end

App	EggVyapar 1.0.5 or later (Android 12+)
Owner / seller	Vinayak Metagoli · +91 7848971006
License type	Lifetime, one phone per key, works offline after activation
Your tool	`scripts\license.bat` in the project folder on your PC
Date	9 November 2026

The whole process at a glance

1 **Customer** installs EggVyapar and sees the **Device code**

→

2 **Customer** sends the Device code to you (WhatsApp / SMS)

→

3 **You** run `license.bat sell` on your PC and get the **license key**

→

4 **You** send the key (starts with `EV1-`) to the customer

→

5 **Customer** pastes the key and taps **Activate** — done for life

> **Only you can make keys.** They are signed with your private key, which stays on your PC. The app contains only the matching public key, checks every key offline, and accepts a key only on the phone whose Device code it was made for. Keep this guide private: it describes where your signing key is kept.

1. How it works

Every phone running EggVyapar has its own **Device code** — 16 characters such as `ZVDX-FBJS-7HJT-ZPDF`. It comes from a secure key created inside the phone (Android Keystore) and stays the same for as long as the app's data is on that phone.

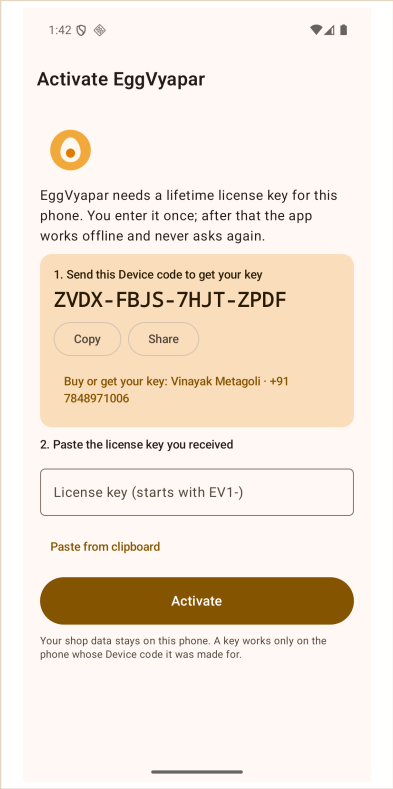

A **license key** (it starts with `EV1-`) contains the license ID, the number of phones allowed and the Device code, and is digitally signed (ECDSA P-256 / SHA-256) with your private key. Because of the signature nobody else can make a key, and changing even one character makes it invalid. Because the Device code is inside, a key shared with someone else does not work on their phone.

Your tool keeps a **registry** of every license: customer, shop, phone number, how many phones are allowed, which phones have keys, and whether the license was issued. It refuses to make more keys than a license allows.

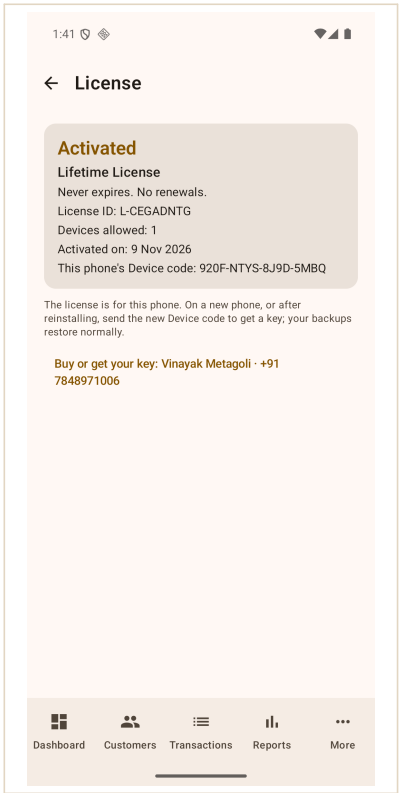

What the customer gets

- **Lifetime license** — never expires, no monthly or yearly renewal.
- **Entered once** — the app never asks for the key again on that phone.
- **Works offline** — no internet is needed to activate or afterwards.
- **Data is safe** — the license check never deletes or changes any business data.
- **More → License** shows Activated · Lifetime License, the license ID, devices allowed and the activation date.

What the customer sees

First start: the Activation screen with the Device code, Copy / Share, and the box for the key

After activation: More → License

2. One-time setup on your PC

> **Already done on 9 Nov 2026:** your signing key was created and its public key is built into the app (release 1.0.5). You do **not** run `init` again — the tool refuses to replace the key, because every key you have sold would stop working.

2.1 Open PowerShell in the project folder

1. Open the folder `C:\Users\Vinayak\Desktop\Vedant\EggBusinessManager` in File Explorer.
2. Click the address bar, type `powershell` and press **Enter**. A blue window opens in that folder.
3. If the project was just downloaded or updated, build the tool once:

PowerShell

```
.\gradlew :license-tool:installDist
```

Every command in this guide starts with `.\scripts\license.bat`. This small launcher always runs the tool with the right Java version (the PC's default Java is too old for it).

2.2 Your private files — back them up today

Everything lives in `C:\Users\Vinayak\.eggvyapar-license\`:

File	What it is	Share it?
`signing-key.pk8`	Your **private** signing key	**Never.** Not on WhatsApp, email, GitHub or a pen drive you lend out
`registry.json`	All licenses, customers, shops, phones, keys	Private (customer data)
`public-key.txt`	The public key (also built into the app)	Harmless

> **If `signing-key.pk8` is lost, you can never again make keys that the installed apps accept.** Copy the whole `.eggvyapar-license` folder to **two** safe offline places (for example an encrypted USB drive kept at home and a password manager). Copy `registry.json` again after selling licenses.

3. Selling a license — step by step

Step 1 — The customer installs EggVyapar

Send the customer the APK file (for example `EggVyapar-1.0.5.apk`) and the installation steps from the user guide. When the app opens the first time it shows **Activate EggVyapar** with the Device code.

Step 2 — The customer sends you the Device code

On the Activation screen the customer taps **Share** and chooses WhatsApp (or **Copy** and pastes it into any message). You receive a message like:

Message from the customer

```
EggVyapar Device code: ZVDX-FBJS-7HJT-ZPDF
```

Step 3 — You make the key

Take the payment first. Then, in PowerShell in the project folder, run **one** command with the customer's details and their Device code (copy-paste the code to avoid typing mistakes):

PowerShell — one phone (the default)

```
.\scripts\license.bat sell --customer "Ramesh Patil" --shop "Patil Eggs" --phone 9876543210
--device ZVDX-FBJS-7HJT-ZPDF
```

The tool registers the license and prints the key (real output):

Output

```
L-GCWXB53E Ramesh Patil | Patil Eggs | 9876543210 devices 0/1 not issued created
2026-11-09T08:14:03.388859300Z
License key for device ZVDX-FBJS-7HJT-ZPDF - send this to the customer:
EV1-061KK-NCMDR-0ZXPY-QNSCK-RSDFV-6QXRE-Y5D10-X9157-YXMF7-3FSW6-BYY4G-7H55D-GTPCW-Q46VC-XTQ0C-SAMR9-
RQPAF-J67FR-KQ124-453NM-6X2HT-7TS31-M3Q2H-NH9PX-H8A2C-HYKEW
```

- `L-GCWXB53E` is the **license ID** — note it next to the customer; you need it for a second phone.
- The long line starting with `EV1-` is the **license key** for that phone.
- To allow more phones on the same license, add `--max-devices 2` (or 3, …) to the command.

Step 4 — You send the key

Select the whole `EV1-…` line in PowerShell (drag with the mouse, then right-click to copy) and send it on WhatsApp. A ready message to adapt:

Message to the customer

```
Thank you for buying EggVyapar!
Your lifetime license key (for this phone only):

EV1-061KK-NCMDR-... (paste the full key)

In the app: copy this key, tap "Paste from clipboard", then "Activate".
Support: Vinayak Metagoli, +91 7848971006
```

Step 5 — The customer activates

1. Long-press the key in WhatsApp and choose **Copy**.
2. Open EggVyapar, tap **Paste from clipboard** (or paste into the box) and tap **Activate**.
3. The app continues to **Create account** (new shop) or **Sign in** (existing data). It never asks for the key again.

> Spaces, line breaks or lower-case letters in a pasted key do not matter — the app tidies them up. Only a **cut-off** key is refused: ask the customer to copy the whole message again.

4. Common situations

4.1 The same customer wants a second phone

Ask for the second phone's Device code and use `issue` with the customer's license ID. If the license allows only one phone, the tool refuses (real output):

Output when the limit is reached

```
Error: L-GCWXB53E (Ramesh Patil) already has 1 of 1 device(s). Raise the limit with: license-tool
set-limit L-GCWXB53E <n>
```

If you agree (for example after an extra payment), raise the limit and issue the key:

PowerShell

```
.\scripts\license.bat set-limit L-GCWXB53E 2
.\scripts\license.bat issue --license L-GCWXB53E --device AAAA-BBBB-CCCC-DDDD
```

Output

```
License key for device AAAA-BBBB-CCCC-DDDD - send this to the customer:
EV1-061KK-NCMDR-15555-5NNNP-6666P-PPGZY-XT8DC-21Z7Q-03KGY-2SCCV-WS2QC-VXNR7-2MXXV-RY7KS-PTZSP-0J332-
RWVCR-HVDT0-V9XHM-ZZNSE-3WS1G-HM9GB-N3N09-JJ9Y3-7C92E-SPV24
```

4.2 The customer reinstalled the app, cleared its data, or bought a new phone

The phone then has a **new Device code** and needs a new key — use `issue` with the same license ID as above. The new phone counts against the limit; raise it with `set-limit` when the old phone is no longer used. After activating, the customer restores their backup (More → Backup & restore) and all data comes back.

4.3 The customer lost the key message

The same phone always gets the same key again, without using up a device:

PowerShell — shows every phone and key of the license

```
.\scripts\license.bat show L-GCWXB53E
```

4.4 Updating the app later

Installing a newer EggVyapar over the old one keeps the activation — no new key is needed. (Only the first update from a version without licensing, such as 1.0.4 → 1.0.5, asks once.)

5. Command reference

All commands start with `.\scripts\license.bat` and run in PowerShell in the project folder.

Task	Command
Sell: register and make the key	`sell --customer "Name" --shop "Shop" --device CODE [--phone 98...] [--max-devices N] [--notes "..."]`
Register now, make the key later	`new --customer "Name" --shop "Shop" [--max-devices N]`
Key for a phone of an existing license	`issue --license L-XXXXXXXX --device CODE`
Change how many phones are allowed	`set-limit L-XXXXXXXX 3`
See all licenses	`list`
One license with its phones and keys	`show L-XXXXXXXX`
Export everything for Excel	`export --file licenses.csv`
Print the public key	`public-key`
Help	`help`

Your records

`list` shows each license with its customer, shop, phone, phones used of allowed, and whether it was issued (real output):

Output of list

```
L-GCWXB53E Ramesh Patil | Patil Eggs | 9876543210 devices 2/2 issued created
2026-11-09T08:14:03.388859300Z
```

`export --file licenses.csv` writes one row per license and phone (license ID, customer, shop, phone, devices allowed, issued, dates, Device code, key, notes) that opens directly in Excel.

6. Messages and what to do

In the app (customer)

Message	Meaning	What to do
This key was made for another phone…	Genuine key, different Device code	Ask for the Device code shown on **this** phone and `issue` a key for it
This is not a complete license key…	Part of the key is missing	Copy the whole message again (from EV1- to the end) and paste
This license key is not valid…	Not made by your tool, or altered	Send the key again from `show`; never type it by hand
Paste the license key first.	The box is empty	Paste the key, then tap Activate

In the tool (you)

Message	What to do
…already has 1 of 1 device(s)…	The limit is reached: `set-limit`, then `issue` (section 4.1)
…is not a device code…	Copy the code exactly as sent (16 characters in 4 groups)
No license L-… in the registry	Check the ID with `list`
No signing key yet	You are on another PC or the folder is missing: restore `.eggvyapar-license` from your backup. Never run `init` again
The license tool is not built yet	Run `.\gradlew :license-tool:installDist` once
Missing --customer (or --shop, --device)	Add the missing part; put names with spaces in quotes

7. Security and honest limits

- Keys cannot be made without your private key, and every key is checked offline against the public key in the app.
- A key works only on the phone it was made for; a shared key does not activate another phone.
- There is **no server**: you cannot remotely switch off a phone that is already activated.
- A determined, skilled person could modify the app to skip the check. The system stops casual copying, not a hacker.
- The phone limit is kept by **your registry** — keep `registry.json` backed up.

- The license check never deletes business data. If a phone loses its activation (e.g. reinstall), the app only shows the Activation screen until a new key is entered.

> **Quick checklist for every sale:** payment received → Device code from the customer → `sell` → send the EV1- key → customer taps Activate → back up `registry.json`.
